#### ABSTRACT

An improved composition for the disinfection of waters in order to render them of potable quality consists of an aqueous solution containing NaClO and NaClO<sub>2</sub>. The composition can be used for the disinfection of a variety of waters, being particularly useful for treating surface waters originating from streams, lakes, and similar sources. A typical compn. is prepd. by mixing 500 g. of 10% NaClO, 100 g. of 80% NaClO<sub>2</sub> and 400 g. of H<sub>2</sub>O. Advantages of the composition are its ability to effect simultaneous deodorization and sterilization of the waters at a relatively low cost and also because it is easy to prep.
